Examples: Making sure windows and doors are locked to unknown members of the public.

Thecasesolutions.com

Windows on the ground do not open far enough for access to go in or out.

Having technology such as buzzers on doors so not every individual has authorization to the doors at all times.

Protection of information

Thecasesolutions.com

Computers and filing cabinets can hold personal and private information about individuals in the services' care. Poor security can enable hackers to hack the system and gain private information on individuals.

Ways to prevent this is to have a strong computer firewalls to prevent others from breaking it down. Strong and sturdy locks, and alarms can prevent paperwork from being stolen within the setting.

Thecasesolutions.com

An example of this would be if a nursing home didn't protect their home properly with no basic computer protection such as passwords or any firewalls. The care home also did not have any alarms to awake staff when an intruder enters the premises. This can allow intruders to steal personal information such as name, address, date of birth, bank details and also information on the kin.
