Landfills, dumps, and garbage piles cover the Earth

Thecasesolutions.com

A photograph of a brown cow standing in a field of trash. The cow is the central focus, looking directly at the camera. The ground is covered with a dense layer of colorful plastic waste, including bags, bottles, and other debris. The background is slightly blurred, showing more of the trash field and another cow partially visible in the distance. The overall scene conveys a message about environmental pollution and its impact on animals.

They corrupt the land and animals.

As well as shorelines and oceans

So what can we do?

Thecasesolutions.com

Turns out lots of smart people have figured out something we can do.

Thecasesolutions.com

From trash to gas

Thecasesolutions.com

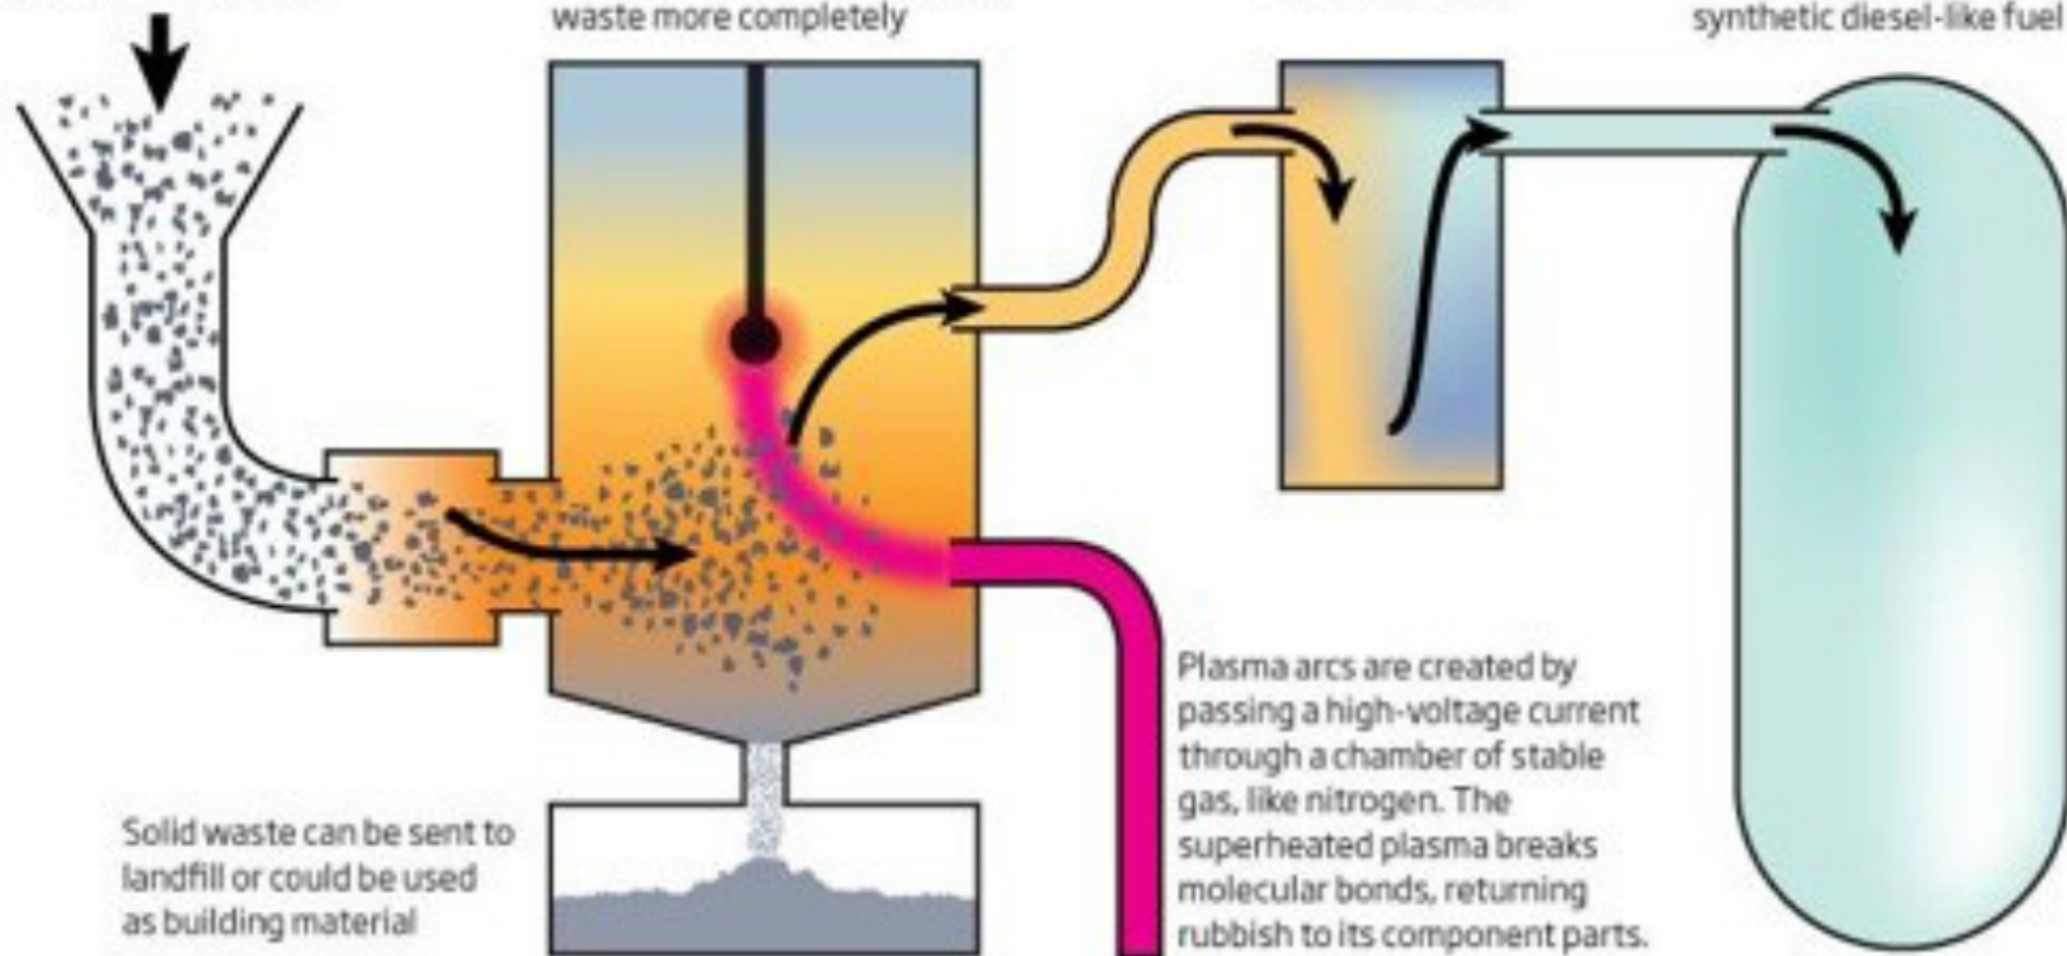

Vaporising household waste could reduce landfill and produce energy

Shredded rubbish is fed into initial gasification chamber

Partially gasified rubbish and gas passes through an arc of superheated plasma to gasify waste more completely

Syngas is filtered and scrubbed clean of toxins

Syngas can be burnt for energy or turned into ethanol, methane or synthetic diesel-like fuel

Step 1: Collect Trash
