Resource Partitioning

Personal Reflection: Ecology
 This image reflects what we have learned in APES. The picture shows a butterfly that is resting on a leaf. Ecology is the study of relationships between what living organisms have with each other and with their abiotic environment. We learned in APES that the biodiversity to sustain for future generation that all components (animals, plants, water, etc.) have to work together. The butterfly and the leaf have a relationship together so that they both can survive and reproduce.

Environmental Sustainability

This picture is important because it shows recycling and protecting the mother earth through sustainability. Through the recycling, we can use the many things that can be recycled. Then the "earth" is the land and water which humans need to protect not destroy. This image inspires me to help make the earth as sustainable as it can be for the future. That means I need to recycle more paper and plastic items and to buy more products that are environmentally friendly. There are many aspects that this picture covered from our APES class. One main topic is the importance of protecting the earth so that future generations can still survive here. Humans are one the most destructive things on the Earth. We have killed off and extracted so many animals and change habitats for our own benefit. Another topic is the importance to keep our water and land pollution free as possible. This means to not dump oil, trash, etc. into our water and to not destroy habitats or the biodiversity on earth. If we "take" something off the Earth, we don't know the effect it will create. It can have chain effects and kill off other more harmful plants, etc.

Personal Reflection: Ecological Footprint

This picture is important to me because it shows a lot of different aspects of the ecological footprint and how humans can "destroy" the earth. It inspires me to do more for this precious earth and to protect the earth as much as possible. It inspires me to use less resources, recycle, and make my ecological footprint as small as possible. Looking at the different aspects of the pictured "foot" you can see forests, then the forest disappear and agriculture is shown. Finally there is an industrialized city that overcomes all the beautiful green. This picture reflects many different items from APES like the importance to reduce, reuse, and recycle. But also to protect the Earth so it sustains for future generations. TheCaseSolution.com

Personal Reflection: Tragedy of the Commons

This picture is important to me because it shows me the "disaster" of Tragedy of Commons in a sarcastic way. The picture shows that the "show" is not good and lacks dialogue. The tragedy of commons is when people overuse and deplete the resources they have. It inspires me to make sure I use my resources sustainably and discourages me from overusing these precious resources. This image reflects many main topics from APES like living sustainably and that humans often use resources to their liking but not realizing the effects it causes.

It can have chain effects and kill off even more animals, plants, etc.

Personal Reflection: Natural Services

This picture is important because it gives an example of a natural service. Some natural services that the ecosystem provides are solar energy production, storage and recycling of nutrients, regulation of climate, and purification of water and air. Some products of natural services are clean drinking water and decomposition of wastes. Natural services need to be protected because the resources are not invulnerable or infinitely available.
