Os fundos de risco são os fundos de investimento que investem em empresas em fase inicial de desenvolvimento, geralmente com o objetivo de obter uma alta taxa de retorno a longo prazo.

Can the strategy for a billion-dollar fund continue to succeed as the pool of assets grows?

The strategy for a billion-dollar fund is to invest in a diversified portfolio of assets, including private equity, venture capital, and real estate. The fund's success depends on its ability to identify and invest in high-growth opportunities. As the pool of assets grows, the fund's strategy must evolve to maintain its success.

*In the long run, how should Yale think about  
the issues of risk and liquidity?*

## *Can the strategy for a billiondollar fund continue to succeed as the pool of assets grew?*

-Yes. It is possible for the billiondollar fund to grow if the strategy is flexible enough to adapt to the mixture of assets and their growth. It is not the same to be in charge of a shoe sales shop, than to be in charge of the shoe sales chain in a state.

-Yale has been careful to have a diversified portfolio, and is now investing in emerging markets (even if skeptical at first), which can help reduce significantly risk.

-The real assets market and performance is quite turbulent so the benefits on the short run may be very volatile, but on the long term, if Yale invests in the right assets might be attractive.

-A fund the size of Yale's, due to its significant weight has more capacity of bouncing back and as Swensen said "...at our size we have different options for liquidity than do smaller funds"

*How should Yale think about the increasing difficulty in determining precise valuations for the endowment?*
